

# Widgets – Overview

A widget is a form that appears as a pop-up window and is an interface for consumers to enter their card information.

## Widget Roles

The widgets perform the following functions:

### Choose a payment method

Let consumers click (or tap) to select their preferred payment method.

The options displayed on this selection screen depend on the content of the widget tag or code. Note that if you specify only one payment method, this selection screen will be omitted.

### Enter required information

The consumer is prompted to enter the required information that is pre-defined for each selected "payment method."

Input fields can also be added by writing widget tags or code .

### What happens in the widget?

Various processes will be carried out for each selected "payment method."

part, Red \*mark After completing the application, the item will wait for the consumer to make payment.

Please be careful not to mistakenly consider this as "payment completed."

Payment Method	process	Post-authentication process
Credit card	Authenticate the card company with the requested process (authorization/capture)	After tokenizing authenticated card information and processing the payment  , the following is described as <Common Processing>: JavaScript can be used to obtain information from the callback webhook API.
Bank transfer	A transfer account will be issued specifically for that application, and the payment will be sent via email (communication will not be confirmed).	Once the service receives notification of the transfer completion, it will be deemed complete. * <Common processing>
Paidy	Go to the Paidy form and authenticate with your email address or phone number	Completion judged at the time of authentication <Common process>
Online Mobile	<a href="#">Click here</a> for details on the behavior of each stock	Completion is determined as soon as this service receives the notification. <Common processing>
Convenience store payment	Select the convenience store where you want to make the payment, apply, and send an email (no communication confirmation required).	Once the service receives notification of payment completion, the payment will be deemed complete. * <Common processing>

\*...If a merchant mistakenly deems a payment to be "completed," the merchant will not be responsible for any damages or liabilities. At our company I take no responsibility

## Display items in the widget

The items displayed in the widget can be controlled by the following parameters when installed:

- Header Text
- Header Description
- Payment button text
- QR code color (Only valid for online mobile)
- Logo in QR code
- Add any field (input column)

## Widget Design

You can edit the widget design from the admin panel.

You can edit your store icon in PNG or JPG format from Store > General > Global Settings > Branding.

If you leave it unedited, the standard (default) image will be displayed.

You can edit the title background and main (used for title bar and buttons) colors by going to Store > Payment Form > Widgets > Themes.

## Consumer payment flow

Please refer to the images below for the payment flow for each payment method when using the widget.
